Lightroom's workflow involves a lot of the same tasks that a traditional desktop publishing program does. I'm not a graphic designer or even a graphic artist. I do art-based work only. But I have used Lightroom to add the correct gradient to an image copied from a sketch for example. Or I can use it to resize an image so that it conforms to a certain aspect ratio, which is something that is particularly useful in putting together a collage from lots of images. It's also a great alternative to working in a digital darkroom. For those users, it's a good way to start editing. In fact, one of my favorite steps in the Lightroom workflow is the "Adds New Workspace." I like to have many workspaces if I'm working on a lengthy project, with each one looking slightly different. Starting in a new workspace gives me a clean slate to create a new set of variables from which I can begin developing a creative vision. In combination with Developer Pro CS6, Adobe Photoshop and Lightroom 5 bring simultaneous editing to Photoshop's brushes and layers. In this review, I will test the Layers Sub-tool or layer-making feature in Adobe Photoshop CS6. Using the Layers Sub-tool, you can open many images simultaneously and edit them using a standard image application. It works well for dual-monitor setups, too. This feature relies on Photoshop's performance capabilities: You will need at least a Quad Core CPU and plenty of RAM. In my test, the Layers Sub-tool does not seem to improve the workflow at all, and it is therefore best to stick to tools and features that are native to Photoshop. Nonetheless, working with multiple images at the same time can be useful for very complex work steps. It might also be very useful for a photographer with a strong workflow and only a few layers of stolen photography in the computer. Just remember to ask yourself whether the idea of simultaneous editing is really necessary in your workflow, or if you would be better off using your Mac or your Nikon's preset that automatically does adjustments one by one. And of course do not forget to check that the new features are supported by your digital SLR and workflow applications!

As part of the suite of new features being available in the beta version, sharing for review allows people to refine and better their artistic vision without leaving Photoshop. This beta update returns to the roots of the application by introducing a new Hangout meeting experience between teams of two or more participants. To start the Hangout, simply click the button and select "meet for review," and an Adobe Air application will be downloaded to everyone's device and begin meeting in a web browser. Alternatively, on desktop, users can install Photoshop Elements just for the

Hangout meeting. Messages, annotations and comments can then be incorporated directly into an image, giving everyone an opportunity to collaborate with their teams and clients in a new way. “We’re continuing to make it easier to share what we’re creating with the world, and the new collaboration features in Photoshop, the world’s leading professional image editing platform, allow us to collaborate more openly with our team and clients,” said Michelle Malcolm, co-founder of the Adobe conversation platform. “We’re excited to introduce Photoshop CS6 and introduce these collaborative features to both Photoshop and Photoshop Elements.” The new Delete and Fill tool, available in the Photoshop desktop app, is both an update to and a departure from the one used to remove objects from photographs. Draft mode removes and replaces an object from an image and replaces the image’s existing texture so that the modified object does not impact the overall look of the canvas. In lieu of changing the canvas’s texture, the tool’s settings can be saved and applied to another file by using the “Create from Settings” option under the new Transform tool.

Like other Photoshop features, these are powerful for graphics and design professionals. But, if you're not a designer or a photographer, they may not be useful you, despite the flashy demos. To use the tool, select Cmd/Ctrl + L (Mac) or select Filter > Adjust > Curves, as shown in the image below. In the first part of the Gradient Map process, you select a hue and saturation that you think will look the best with a gray or black background, as shown here. In the second step, you’ll can select the gradient you’ve chosen, and you can use a freeform tool called the Gradient Map to change the blend mode. You can use the gradient tool to create specific gradients, for instance. Gradients, like the two shown here, can be used to create artistic images.
